# Redesigning a digital experience

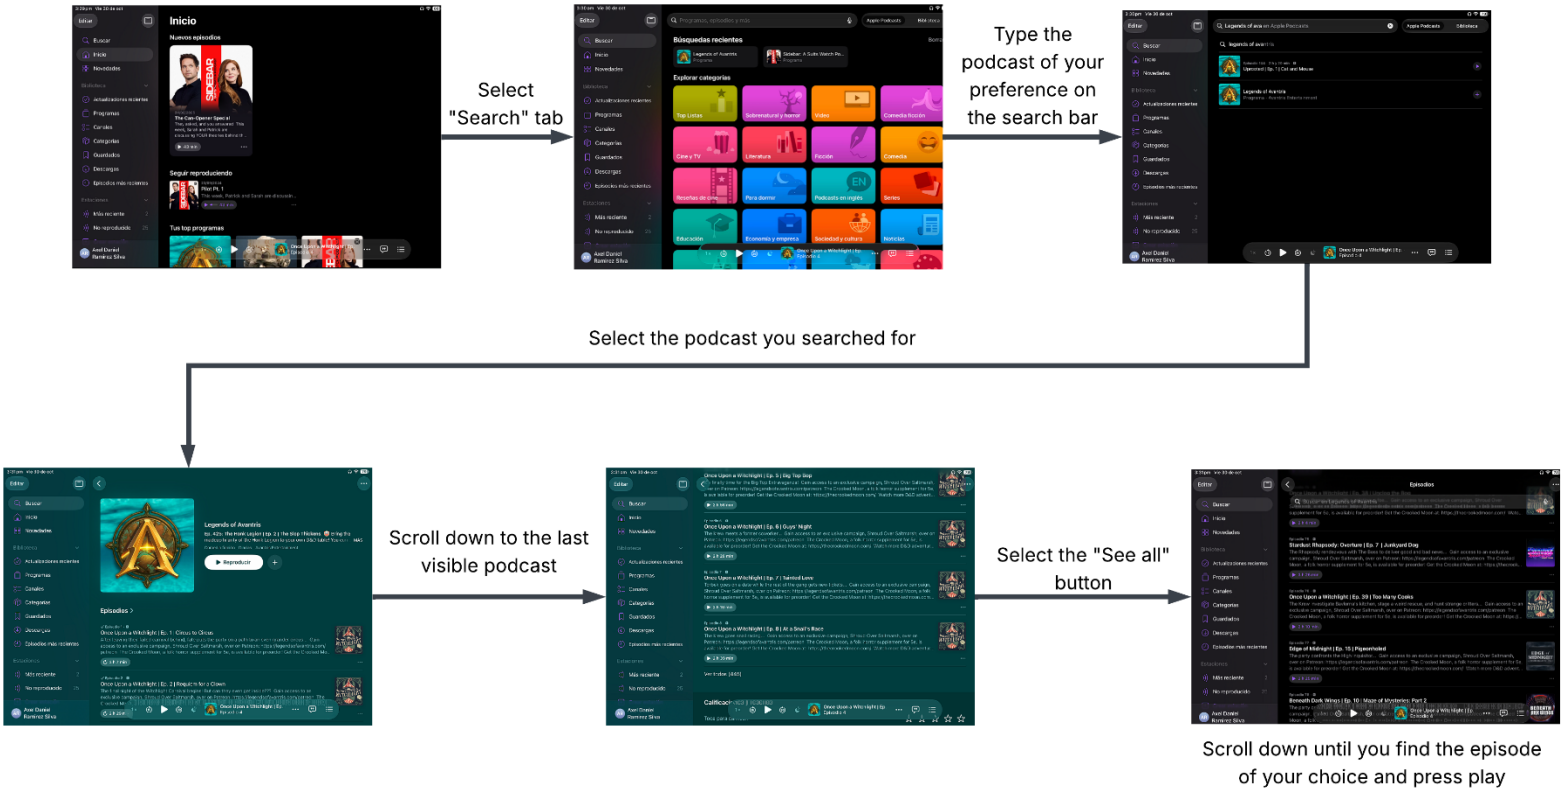

## Selected application

**App name:** Apple Podcasts

**Selected feature:** Reproduction of a podcast

**Brief explanation of the task:** Pressing play to reproduce a specific podcast episode from a creator

## Current user flow

## UX Analisis

The functionality of the Apple Podcasts app is pretty straightforward, you enter the app, select a creator, choose an episode and press play, however, there is one factor that diminishes this whole process, which is the lack of organization regarding the episodes. What does this mean?

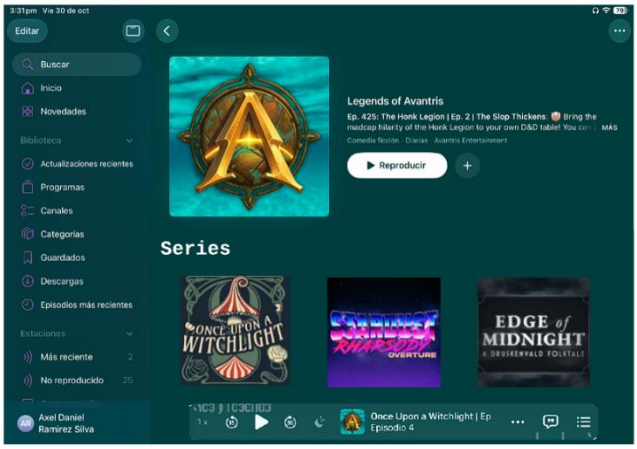

Axel Daniel Ramírez Silva
A01704206

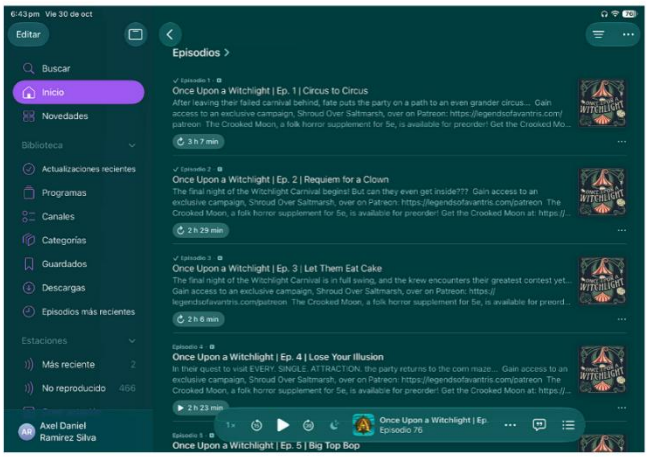

A creator can create multiple episodes talking about different topics in every new episode, or only about one topic which is spoken across multiple episodes as sequels to create a series or do both at different times to bring more variation to their channel. The main issue with this, is that the app only lets the target user visualize all the episodes as a list, starting with the earliest episodes released by the creator all the way down to the latest and mixing all their different series on the same list without a proper separation or identification of them, meaning that if a user wanted to reach a specific episode he would have to scroll down for quite a while to reach what he is looking for. This is especially an issue for the series as the user could be easily misled to think that the next episode on the list is related to the series he was watching but it turns out to be an episode of an entirely different series without any relation at all.

The user could use the search bar to ease the process, however, in most case scenarios the user does not keep in the back of their mind the title of the episode or is not aware of the title of the next episode, so once again, they'll have to scroll to find what they are looking for amongst all the episodes and series that exist on the list

## Design proposal

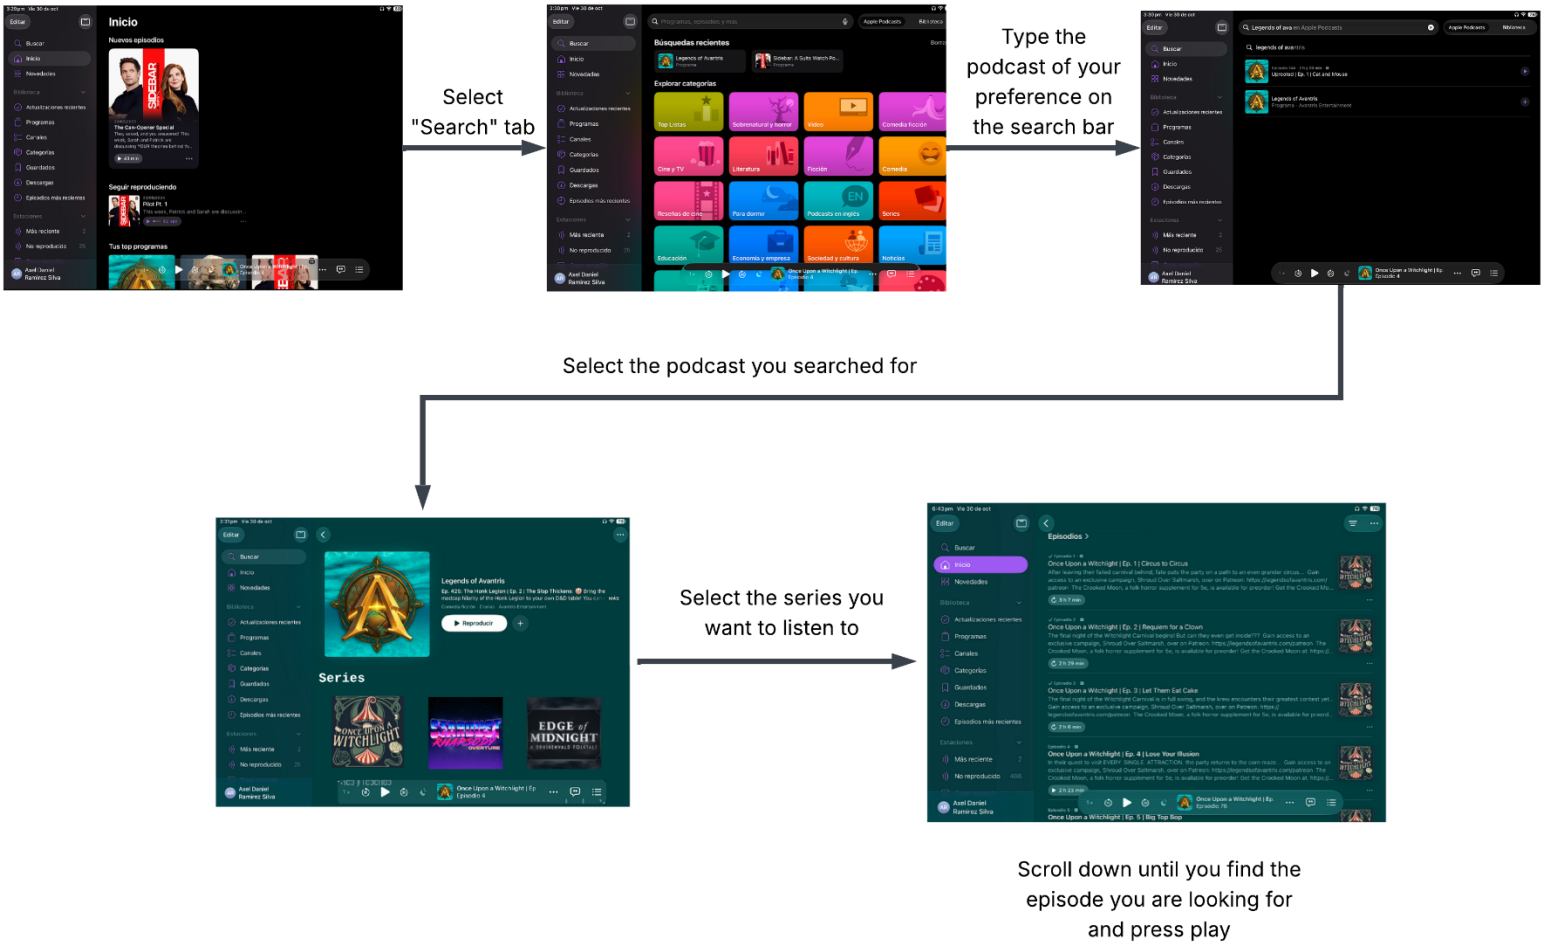

The change that I believe would be key, is the addition of separation by series so that if the creator has multiple of them the user can look for a specific one without having to scroll past unrelated episodes and be only looking for the last one he saw in the series

# Proposed user flow

## Justification

Even though the modification I chose to make looks very simple, it adds an extra layer of visual hierarchy and time saving.

This modification helps the user identify with more ease the episode he is looking for, this is due to the removal of unrelated episodes in each new created series, reducing by great amounts the time the user would have to scroll to find the specific episode he is looking for and it also eliminates the misleading nature that the list had with following unrelated episodes
